

SHADEQUARTERS

ShadeSail Measuring Guide

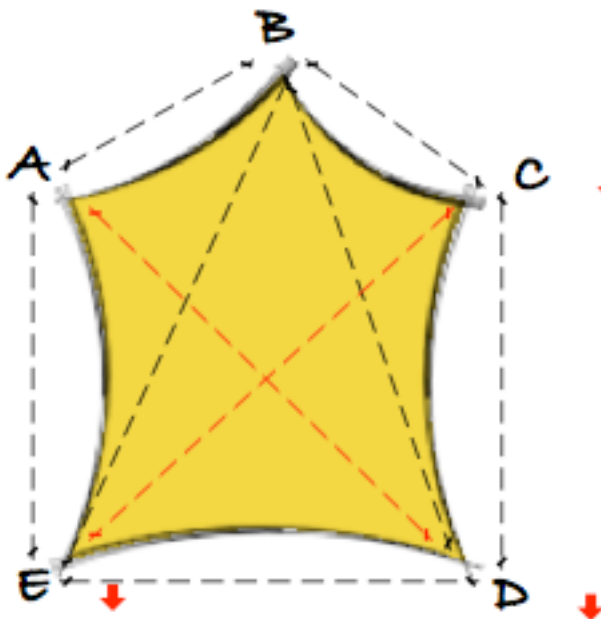

To accurately make your sail fit your location perfectly we need many measurements. Our Instant Quote system does not require all of the data in order to estimate size (dotted red lines) but we will eventually need them all. This document contains blank worksheets for you to collect all the data you'll need to give us when the fabrication process begins.

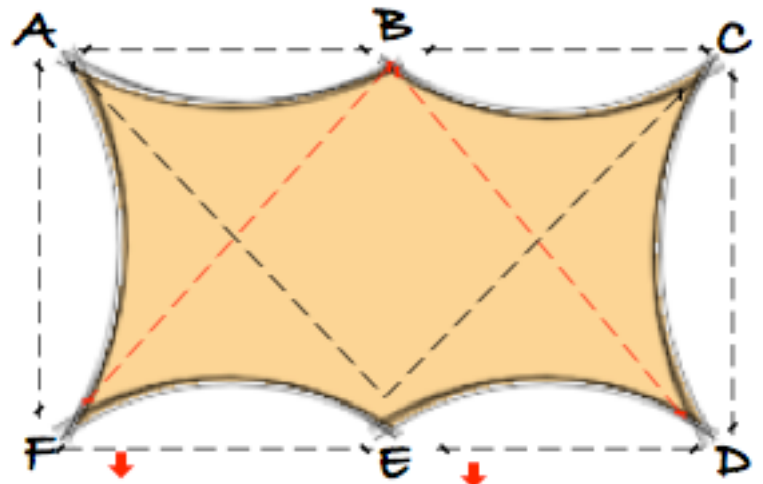

3 Measures required

6 Measures required

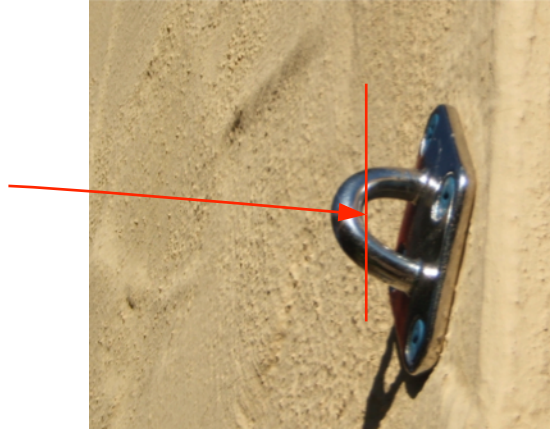

9 Measures required

10 Measures required

How to Measure

*Measuring for shade sails requires accuracy to within 1/4"
Measures should be from the back face of the attachment loop
to the corresponding face of the next attachment loop.*

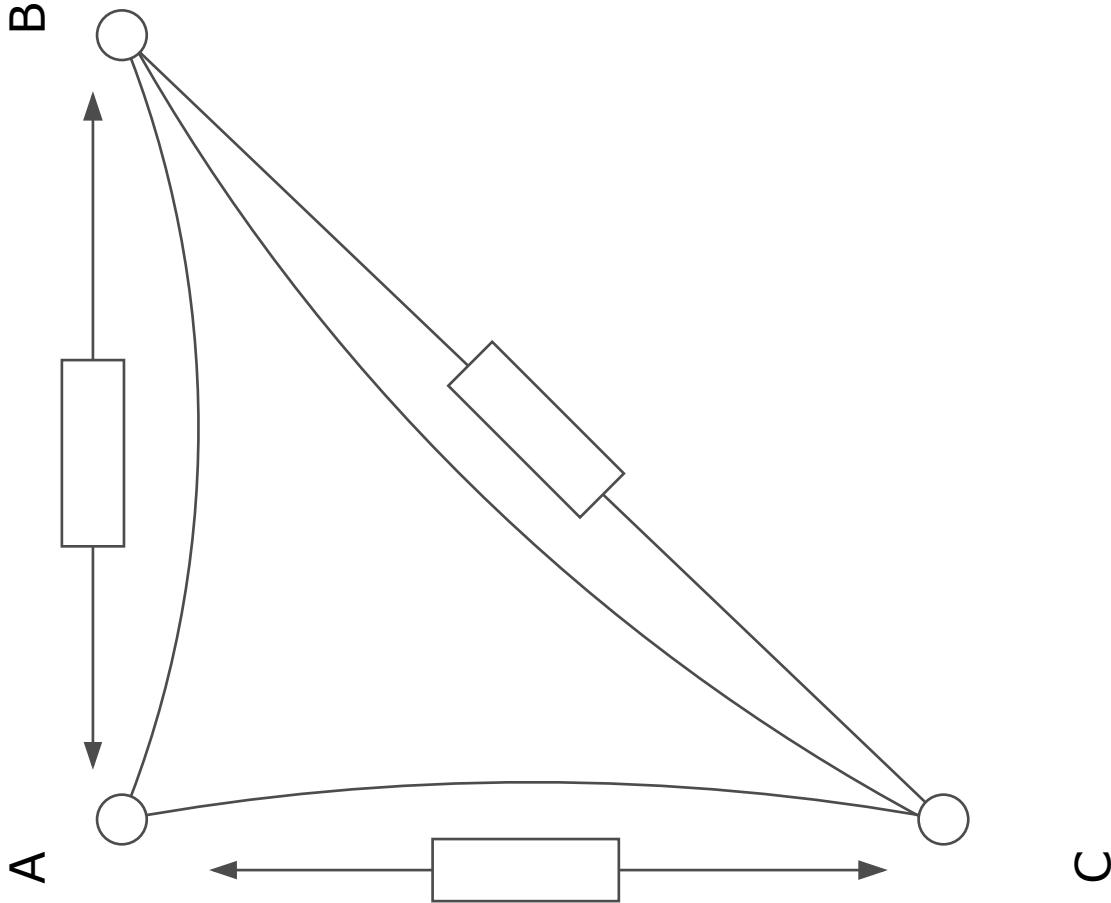

If measuring by one person you'll need to use a d-shackles to connect one end of the flexible tape so that it can be pulled extremely tight. Remember to add back the additional distance that is created by the addition of the shackle

Make sure you notate the position of the sail within the structure and the number of the sails (when multiples are involved). Detailed notes will be essential when sorting out the sails to mount them. It will at least a couple of weeks after you've measured that you'll be installing the sails.

DO NOT RELY ON MEMORY!!

3-Sided Sail

Position A Located:

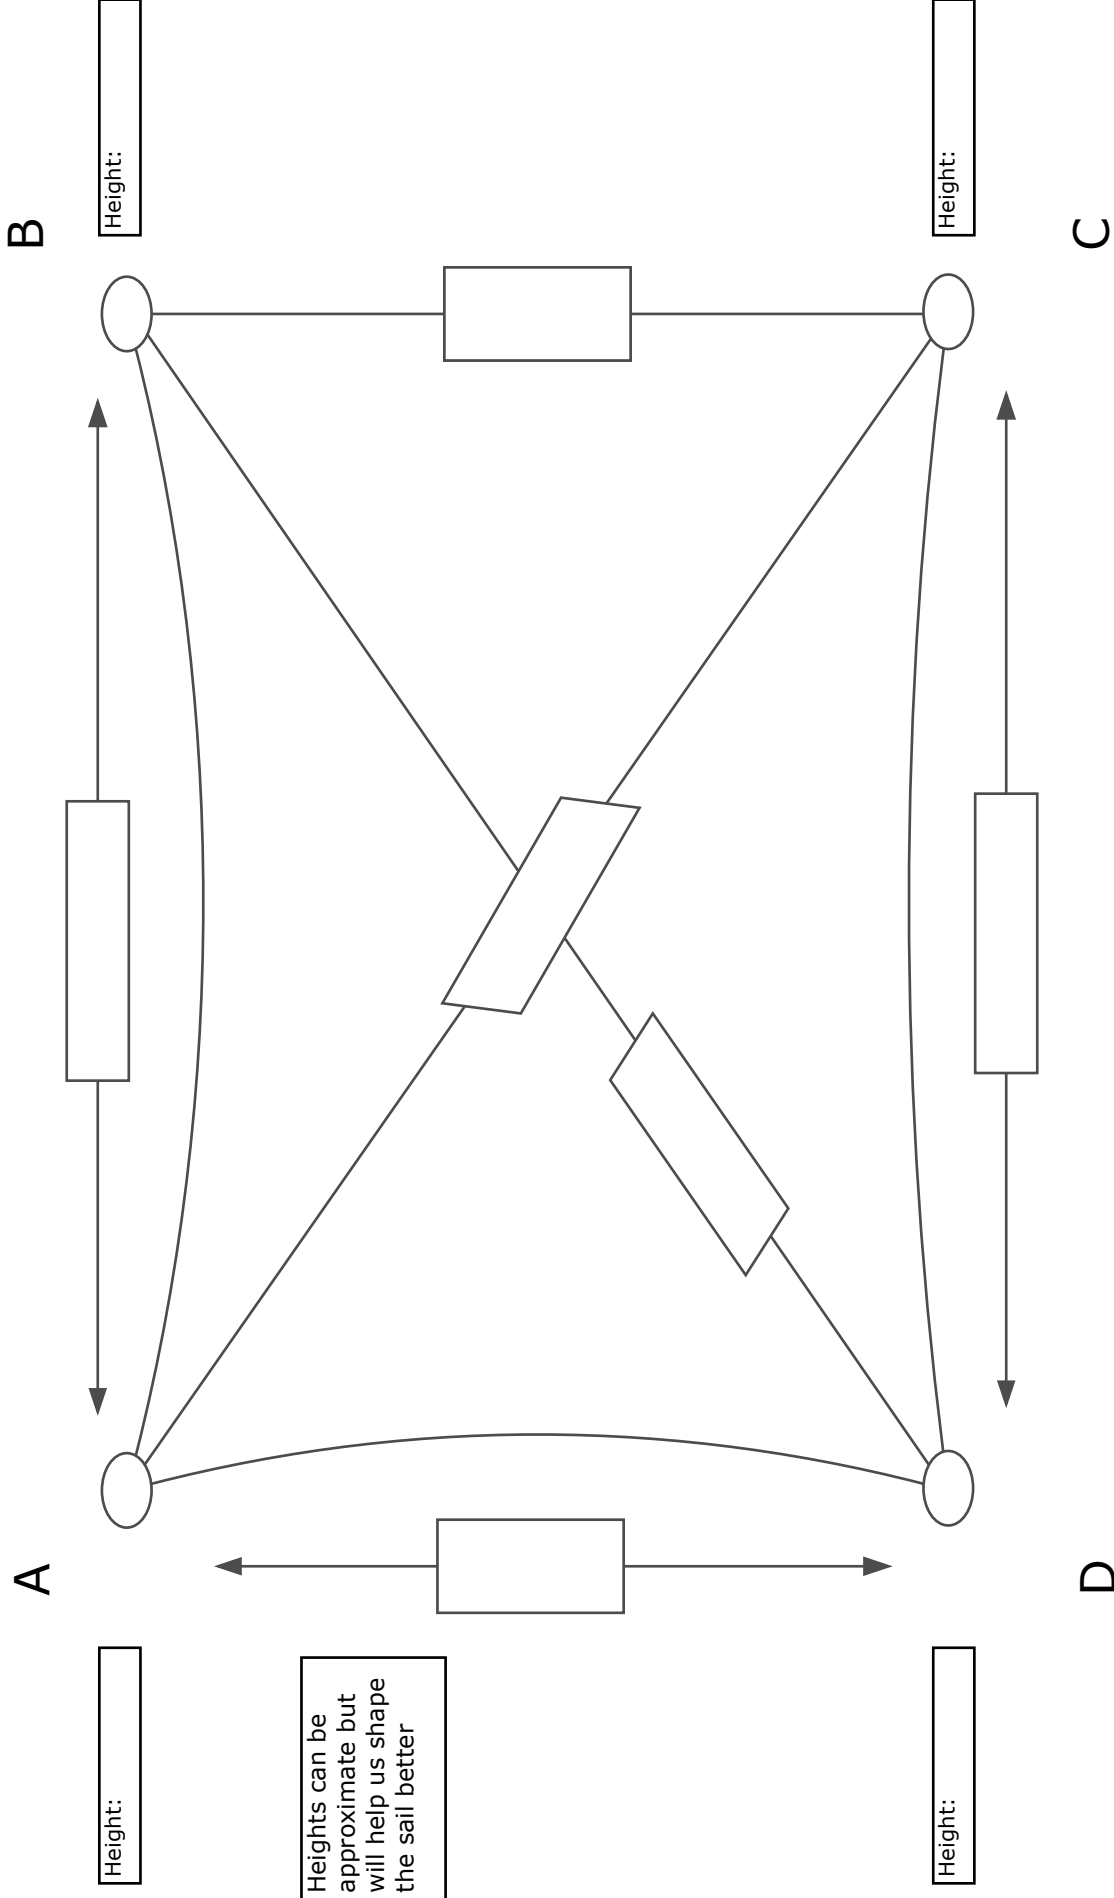

A description of the physical location of point A can be helpful to orient the sail for installation.

Sail Number:

Fabric:
